**Background:** SIGMAR1 encodes a receptor protein that interacts with a variety of psychotomimetic drugs, including cocaine and amphetamines. The receptor is believed to play an important role in the cellular functions of various tissues associated with the endocrine, immune, and nervous systems. As indicated by its previous name, opioid receptor sigma 1 (OPRS1), the product of SIGMAR1 was erroneously thought to function as an opioid receptor; it is now thought to be a non-opioid receptor. Mutations in SIGMAR1 has been associated with juvenile amyotrophic lateral sclerosis 16. Alternative splicing of SIGMAR1 results in transcript variants encoding distinct isoforms.

**Application Notes:** Optimal working dilutions should be determined experimentally by the investigator. Suggested starting dilutions are as follows: WB (1:500-1:2000), ELISA (1:5000-1:20000).
