Background: TSSC4 is one of several tumor-suppressing subtransferable fragments located in the imprinted gene domain of 11p15. , an important tumor-suppressor gene region. Alterations in this region have been associated with the Beckwith-Wiedemann syndrome, Wilms tumor, rhabdomyosarcoma, adrenocortical carcinoma, and lung, ovarian, and breast cancer. This gene is located among several imprinted genes; however, this gene, as well as the pan-hematopoietic expression gene (PHEMX), escapes imprinting. This gene may play a role in malignancies and disease that involve this region. Several transcript variants encoding two different isoforms have been found for this gene. TSSC4 (Tumor Suppressing Subtransferable Candidate 4) is a Protein Coding gene. Diseases associated with TSSC4 include Beckwith-Wiedemann Syndrome and Wilson-Turner Syndrome.

Application Notes: Optimal working dilutions should be determined experimentally by the investigator. Suggested starting dilutions are as follows: WB (1:500-1:2000), ELISA (1:5000-1:20000).
