Renilla Luciferase Reporter Gene Assay Kit

Cat #: KTA8012 Size: 100 T/1000 T

	Renilla Luciferase Reporter Gene Assay Kit		
REF	**Cat #:** KTA8012	LOT	**Lot #:** Refer to product label
	Applicable samples: Cells, Protoplasts and Plant leaves		
	Storage: Stored at -20℃ for 12 months, protected from light		

Assay Principle

In the presence of oxygen, Renilla luciferase can catalyze the oxidation of coelenterazine to coelenteramide, and light signals are also generated during the oxidation of coelenterine. Through the Bioluminescence system of Luciferase and its substrate, gene expression can be detected very sensitively and efficiently. Usually, the Transcriptional regulation element or 5'-promoter region of the gene of interest is cloned upstream of Luciferase, or the 3'- UTR region is cloned downstream of Luciferase to construct a Reporter gene plasmid, and then transfect the cell, treat the cell with appropriate drugs, and then Lytic cells. The Transcriptional regulation effect of drug treatment on the target gene is judged by detecting the activity of Luciferase. This kit has the characteristics of rapid detection, high sensitivity, wide detection range and no interference from intracellular activity.

Materials Supplied and Storage Conditions

Kit components	Size		Storage conditions
	100 T	1000 T	
Renilla Luciferase Lysis Buffer (5×)	10 mL	100 mL	-20℃
Renilla Luciferase Assay Buffer	10 mL	100 mL	4℃
Renilla Luciferase Substrate (50×)	200 μL	2×1 mL	-20℃, protected from light

Materials Required but Not Supplied

- Cell culture plate, precision pipettes, disposable pipette tips
- Deionized water , PBS, deionized water
- Refrigerated centrifuge, 96-well black plate or 96-well white plate
- Luminometer or multimode reader

Reagent Preparation

Renilla Luciferase Lysis Buffer: Prepare before use. Dilute Renilla Luciferase Lysis Buffer (5×) 5 times with deionized water to

obtain Renilla Luciferase Lysis Buffer, Store at -20℃.

Renilla Luciferase Solution: Prepare before use, according to the actual usage, mix an appropriate amount of Renilla Luciferase Assay Buffer and Renilla Luciferase Substrate (50×) in a ratio of 50:1.

Note: Renilla Luciferase Solution needs to be ready each time, Renilla Luciferase Substrate was dissolved in anhydrous ethanol, it is necessary to centrifuge to the bottom of the tube immediately before use, and carefully measure the volume of the solution in the tube. If there is a significant decrease in liquid volume, please add anhydrous ethanol to replenish the volume and store it.

Assay Procedure

1. Cell lysis:

(1) Cells

a. Cells were cultured in appropriate well plates, then transfected and treated with appropriate methods.

b. Remove the medium, gently wash the cells with PBS twice (do this for the adherent cells, suspended cells can be directly centrifuged to collect cells), discard PBS, and add the Lysis Buffer as follows.

Reagent	96-well Plate	48-well Plate	24-well Plate	12-well Plate	6-well Plate
Renilla Luciferase Lysis Buffer (μL)	100	150	200	300	500

Note: If the expression level of luciferase is low, the amount of Renilla Luciferase Lysis Buffer can be appropriately reduced, such as adding 100 μL to 24-well plate per well and 200 μL to 6-well plate per well.

c. Place the cells on a shaking table and shake for 5-10 min to fully lysate the cells.

d. Centrifuge the cell lysate at 10,000 rpm for 2 min, and take the supernatant for detection.

(2) Protoplasts (for reference only)

a. Prepare protoplasts and transform the corresponding plasmids into protoplasts.

b. Collect 2×10^5 protoplasts by centrifugation after 16-24 h, add 200 μL Renilla Luciferase Lysis Buffer.

c. Incubate at room temperature for 5-10 min to fully lysate the protoplasts.

d. Centrifuge the protoplast lysate at 10,000 rpm for 2 min, and take the supernatant for detection.

(3) Plant leaves (for reference only)

a. Inject Agrobacterium containing the corresponding plasmid into plant leaves.

b. Take approximately 1 cm^2 of leaves 2 days after injection and add 500 μL Renilla Luciferase Lysis Buffer, grind with homogenizer and centrifuge at 10,000 rpm for 2 min, take the supernatant for detection.

Note: After cell lysis, luciferase activity can be immediately detected, and it can also be frozen for further testing if necessary. The frozen sample should be melted to room temperature before testing.

2. Carefully aspirate 20-100 μL (If the sample is sufficient, please add 100 μL. If the sample is insufficient, the usage of the sample can be appropriately reduced, but the usage of each batch of samples should be consistent.) of cell lysis supernatant into a detection tube or 96-well black/white plate plate. Then add 100 μL of Renilla Luciferase Solution equilibrated to room temperature into the tube or plate, mix quickly, and immediately detect the Renilla Luciferase reporter gene activity by using luminometer or multimode reader.

Precautions

1. Due to the influence of temperature on enzyme reactions, both the sample and solution need to be equilibrated to room temperature before testing.
2. To achieve the best measurement effect, when using a single tube luminometer for measurement, the time from mixing each sample and solution to before measurement should be controlled as consistent as possible. When using a multimode reade with chemiluminescence detection function, it is advisable to add all samples first, and then add Renilla Luciferase Solution.
3. During testing, a 96-well black or white plate should be used to prevent interference from adjacent wells.
4. The maximum wavelength of bioluminescence catalyzed by Renilla Luciferase is 480 nm.

Recommended Products

Catalog No.	Product Name
KTA8010	Dual Luciferase Reporter Gene Assay Kit
BMC1041	Luminescent Mycoplasma Detection Kit
PRP3004	Luciferase firefly
