|   | <b>Applicable samples:</b> Animal Tissue, Plant Tissue, Cells, Bacteria, Serum, Plasma |            |                                      |
|  | <b>Storage:</b> Stored at -20°C for 6 months, protected from light                     |            |                                      |

### Assay Principle

Sorbitol Dehydrogenase (SDH, EC 1.1.1.14), which catalyzes the dehydrogenation of sorbitol to produce fructose, is one of the health enzymes that regulate the content of sorbitol in living organisms. CheKine™ Micro Sorbitol Dehydrogenase Assay Kit provides a simple, convenient and rapid SDH activity detection method, which is suitable for the detection of animal and plant tissues, cells, bacteria, serum (plasma) and other samples. The detection principle is that SDH catalyzes the dehydrogenation of sorbitol to fructose while reducing NAD<sup>+</sup> to produce NADH and measuring the rate of increase in absorbance at 340 nm allows calculation of SDH activity.

### Materials Supplied and Storage Conditions

| Kit components    | Size  |        | Storage conditions          |
|-------------------|-------|--------|-----------------------------|
|                   | 48 T  | 96 T   |                             |
| Extraction Buffer | 50 mL | 100 mL | 4°C                         |
| Reagent I         | 4 mL  | 8 mL   | 4°C                         |
| Reagent II        | 1     | 1      | 4°C                         |
| Reagent III       | 1     | 1      | -20°C, protected from light |

### Materials Required but Not Supplied

- Microplate reader or ultraviolet spectrophotometer capable of measuring absorbance at 340 nm
- 96-well UV plate or microquartz cuvette, precision pipettes, disposable pipette tips
- Ice maker, refrigerated centrifuge, water bath
- Deionized water
- Homogenizer (for tissue samples)

### Reagent Preparation

**Extraction Buffer:** Ready to use as supplied. Equilibrate to room temperature before use. Store at 4°C.

**Reagent I:** Ready to use as supplied. Equilibrate to room temperature before use. Store at 4°C.

**Reagent II:** Prepared before use. add 3 mL deionized water for 48 T and 6 mL deionized water for 96 T to fully dissolve. Unused reagents can also be stored at 4°C after aliquoting.

**Reagent III:** Prepared before use. add 3 mL deionized water for 48 T and 6 mL deionized water for 96 T to fully dissolve. Unused reagents can also be stored at -20°C and protected from light after aliquoting to avoid repeated freezing and thawing.

## Sample Preparation

**Note: Fresh samples are recommended, If not assayed immediately, samples can be stored at -80°C for one month. All samples and reagents should be on ice to avoid denaturation and deactivation.**

1. Animal tissues: Weigh 0.1 g tissue, add 1 mL Extraction Buffer and homogenize on ice. Centrifuge at 8,000 g for 10 min at 4°C. Use supernatant for assay, and place it on ice to be tested.

2. Plant tissues: Weigh 0.1 g tissue, add 1 mL Extraction Buffer and mash. Ultrasonic break in ice bath 5 min (power 20% or 200 W, ultrasonic 3 s, interval 7 s, repeat 30 times). Centrifuge at 8,000 g for 10 min at 4°C. Use supernatant for assay, and place it on ice to be tested.

3. Cells or bacteria: Collect  $5 \times 10^6$  cells or bacteria into the centrifuge tube, wash with cold PBS, discard the supernatant after centrifugation; add 1 mL Extraction Buffer to ultrasonically disrupt the cells or bacteria 5 min (power 20% or 200 W, ultrasonic 3 s, interval 7 s, repeat 30 times). Centrifuge at 8,000 g for 10 min at 4°C. Use supernatant for assay, and place it on ice to be tested.

4. Serum (Plasma): Direct detection.

**Note: It will be better to quantify the total protein with Protein Quantification Kit (BCA Assay), Cat #: KTD3001, if the content is calculated by protein concentration.**

## Assay Procedure

1. Preheat the microplate reader or ultraviolet spectrophotometer for more than 30 min, and adjust the wavelength to 340 nm, ultraviolet spectrophotometer was returned to zero with deionized water.

2. Sample measurement. (The following operations are operated in the 96-well UV plate or microquartz cuvette)

| Reagent   | Test Well ( $\mu\text{L}$ ) |
|---|-----------------------------|
| Reagent I   | 80                          |
| Reagent II  | 60                          |
| Reagent III   | 60                          |
| Mix and incubate for 5 min at 37°C (mammal) or 25°C (other species) |                             |
| Sample  | 10                          |

3. After mixing quickly, record the absorbance values of 20 s at 340 nm, mark as  $A_1$ , then react for 2 min at 37°C (mammal) or 25°C (other species), record the absorbance values of 2 min 20 s at 340 nm, mark as  $A_2$  and calculate  $\Delta A_{\text{Test}} = A_2 - A_1$ .

**Note: Blank well only needs to measure 1-2 times. In order to guarantee the accuracy of experimental results, need to do a pre-experiment with 2-3 samples. If  $\Delta A_{\text{Test}}$  is less than 0.001, increase the sample quantity appropriately. If  $\Delta A_{\text{Test}}$  is greater than 0.5, the sample can be appropriately diluted with Extraction Buffer, the calculated result multiplied by the dilution factor. It is not suggested to test too many samples at the same time, because enzyme activity is calculated by the variation of absorbance value per unit time.**

## Data Analysis

**Note: We provide you with calculation formulae, including the derivation process and final formula. The two are exactly equal. It is suggested that the concise calculation formula in bold is final formula.**

## A. 96-well UV plates calculation formula

### 1. Calculation of SDH activity in serum

Unit definition: One enzyme activity unit defines as 1 nmol NADH consumed by each mL of serum per min.

$$\text{SDH (U/mL)} = \frac{[\Delta A_{\text{Test}} \times V_{\text{Total}} \div (\epsilon \times d) \times 10^9] \div V_{\text{Sample}}}{T} = \mathbf{3,376 \times \Delta A_{\text{Test}}}$$

### 2. Calculation of SDH activity in tissue of the sample

(1) Calculation according to the protein concentration of the sample

Unit definition: One enzyme activity unit defines as 1 nmol NADH consumed by 1 mg tissue proteins per min.

$$\text{SDH (U/mg prot)} = \frac{[\Delta A_{\text{Test}} \times V_{\text{Total}} \div (\epsilon \times d) \times 10^9] \div (V_{\text{Sample}} \times \text{Cpr})}{T} = \mathbf{3,376 \times \Delta A_{\text{Test}} \div \text{Cpr}}$$

(2) Calculation according to the weight of the sample

Unit definition: One enzyme activity unit defines as 1 nmol NADH consumed by 1 g tissue per min.

$$\text{SDH (U/g fresh weight)} = \frac{[\Delta A_{\text{Test}} \times V_{\text{Total}} \div (\epsilon \times d) \times 10^9] \div (W \div V_{\text{Extraction Buffer}} \times V_{\text{Sample}})}{T} = \mathbf{3,376 \times \Delta A_{\text{Test}} \div W}$$

### 3. Calculation of SDH activity in cells or bacteria

Unit definition: One enzyme activity unit defines as 1 nmol NADH consumed by  $10^4$  cells or bacteria per min.

$$\text{SDH (U/10}^4) = \frac{[\Delta A_{\text{Test}} \times V_{\text{Total}} \div (\epsilon \times d) \times 10^9] \div (V_{\text{Sample}} \div V_{\text{Extraction Buffer}} \times 500)}{T} = \mathbf{6.75 \times \Delta A_{\text{Test}}}$$

Where:  $V_{\text{Total}}$ : the total volume of the reaction system, 0.21 mL =  $2.1 \times 10^{-4}$  L,  $V_{\text{Extraction Buffer}}$ : the volume of the Extraction Buffer, 1 mL;

$V_{\text{Sample}}$ : the volume of the supernatant in the reaction system, 0.01 mL;  $\epsilon$ : NADH molar extinction coefficient,  $6.22 \times 10^3$  L/mol/cm;  $d$ :

96-well UV plate diameter, 0.5 cm; Cpr: protein concentration (mg/mL); T: reaction time, 2 min; W: sample weight, g; 500: total

number of cells or bacteria, 5 million;  $10^9$ : unit conversion factor, 1 mol =  $10^9$  nmol.

## B. Microquartz cuvette calculation formula

The optical diameter  $d$ : 0.5 cm in the above calculation formula can be adjusted to  $d$ : 1 cm for calculation.
